

- At the moment I have some difficulties understanding all the functions of Github and I want to better understand that tool so that in the future I can work with it more efficiently. I have plans to look into the programming platform I use, IntelliJ, and see what functions there can be connected to Github so that I can upload the code to Github via the platform.
- I have been using a tool called Express and the others in the group have not used it before so I believe that I can introduce it to them and hear if they want this for our project. I believe that this tool will help our project and make our process more efficient.
- For this week I was not the scrum master, but all of us in the group have decided who will be scrum master for this and the following weeks.
- For this week I was in charge of creating the navigation menu and the footer of the application's page. I knew that I had to use html, css and javascript to make that happen. After we had decided in the group on who works with what, I started working on my parts. I knew how I wanted the design to look like but I was not so sure on what to call specific buttons and clickable things but I thought that could wait so that the other members in the group can decide on what names are the best. This is something we can continue to work on the next weeks. For example, we decided to keep the footer neutral for the moment and perhaps add social media buttons to it in the future.
